Laser Hair Reduction

Iowa Plastic Surgery uses an **Apex 800 Diode Laser** for Laser Hair Reduction treatments. Laser Hair Reduction treatments may be done on any color of skin and may cause a reduction of hair growth on the treated site after three to four treatments. Hair grows in cycles and may actually lie dormant (not growing) for periods of time therefore treatments are spaced every 4 – 6 weeks apart. After consecutive treatments there will normally be no hair growth for about three months. If multiple treatments are performed there may be a permanent reduction of hair growth.

Laser hair reduction works best on dark/coarse hair, but may also reduce some of the lighter, brown hair that can be bothersome. There is no downtime with this treatment. While this Laser Hair Reduction treatment is state of the art it, like all laser hair reduction treatments, is not guaranteed.

*Results from Laser Hair Reduction Treatments are not always permanent.
Results may range from marked reduction to lighter growth.
Occasionally, there is little or no permanent hair reduction.*
